## Project description

The project is to play whac-a-mole. The moles are LEDs and buttons are used to indicate whether the moles are hit or not. An Arduino Mega is the microcontroller used for this project.

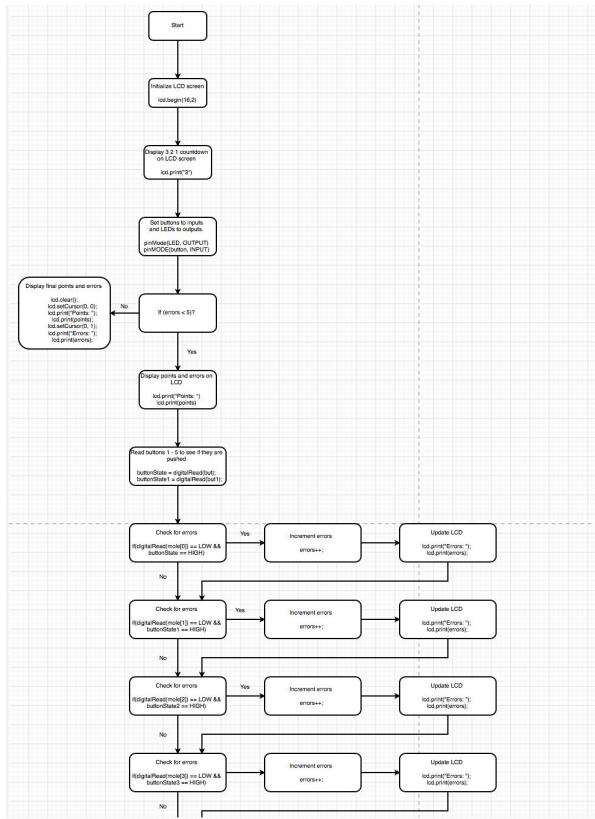

The rate the moles pop up increase as more points are earned. In order to lose the game, 5 errors need to be acquired. To get an error, the player must either miss a mole or hit a space where a mole is not at. score and errors are displayed on an LCD screen.

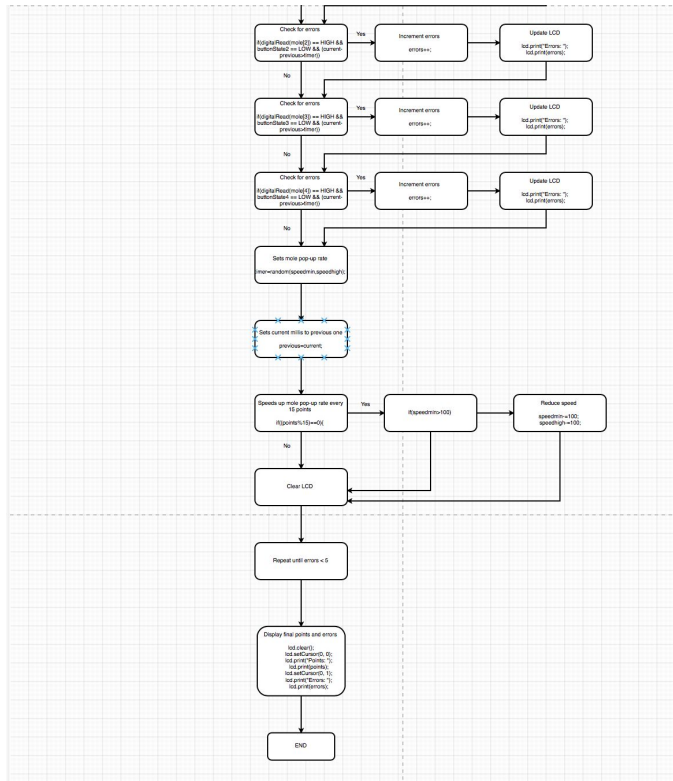

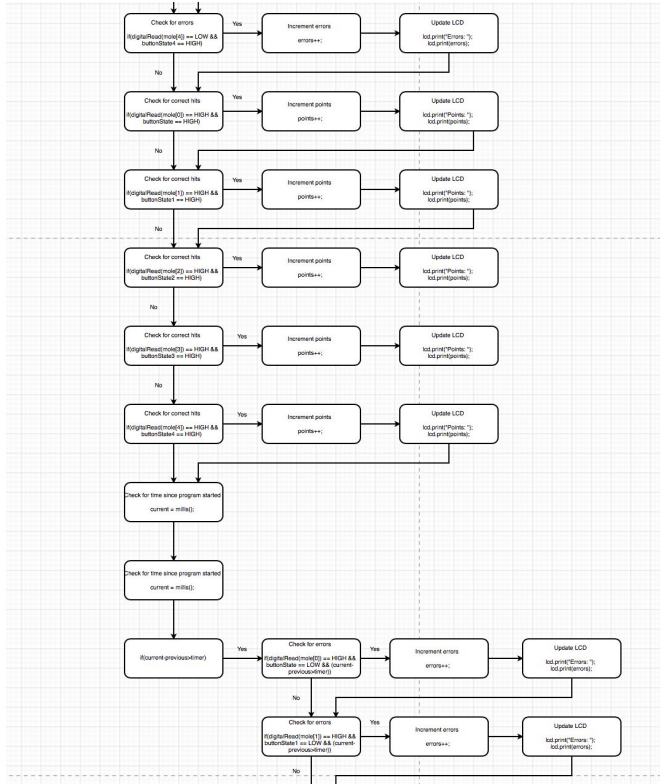

## System design

### High level block diagram

## Flowchart

## Implementation code

```
if(digitalRead(mole[0]) == LOW && buttonState == HIGH) // checks if hits empty space
```

```
if(digitalRead(mole[0]) == HIGH && buttonState == HIGH) // checks if mole is hit
```

```
if(digitalRead(mole[0]) == HIGH && buttonState == LOW && (current-previous>timer) // checks  
if mole is missed
```

```
if(current-previous>timer) // timer
```

```
current = millis(); // delay without using delay()
```

```
digitalWrite(mole[random(0,sizeof(mole)/sizeof(int))],HIGH); // randomly displays moles
```

```
timer=random(speedmin,speedhigh); // sets mole pop-up rate to a variable
```

```
previous=current; // sets current millis to previous one
```

```
if((points%15)==0) // speeds up mole pop-up rate every 15 points
```

## **Discussion**

Finding a way to delay without using the delay() function:

If we used the delay() function in Arduino, the whole program stops and the timing of the hits would not work. We needed to find a way to delay while the code still runs. So we used millis() instead of delay(). millis() keeps track of how long the code has been running and we use that as our timer.

A limitation of our design is that only one mole pops up at once. An improvement would be that multiple moles would be up at the same time.

## **Responsibilities**

Jeffrey Lee: debugging code and rewiring hardware

Karen Escareno: Hardware and Code

## **Conclusion**

We successfully achieved the goal for the Whac-a-mole game. Moles pop up randomly and speed up as points are obtained. There are definite improvements that can be made for this game. Overall the project works well.
